- 5. On 30 November, an air force unit turned in 10 Studebaker chassis which were to be fitted with workshop bodies.
- 6. Other material that arrived in Oberschoeneweide during the period of observation included carloads of old tank chains and tank wheels which were to be used in the foundry; several carloads of tank wheels which were to be finished at the shop and numerous carloads of sand for the foundry.
- 7. The rail cars consist of a platform mounted on four wheels which have a gauge of 750 mm. Each of the vehicles is fitted with a carrying device adjustable in height and designed to support the axle of a motor vehicle. Two such rail cars can carry one motor vehicle. The rail cars are apparently used by large enterprises.
- 3. In mid-Docember, a model car, similar to a jeep but about 1 meter longer and with a superstructure with windows, was turned in at the shop. One hundred such vehicles were to be delivered. These small buses were provided with seats for about 11 to 14 persons. The extension of the jeep chassis was made at Zeesen, while the bus superstructure was fitted in Oberschoeneweide. Since mid-February 1954, the vehicles have been provided with superstructures of small trucks which had 40-cm sidewalls and bows for tarpaulins.

25X1 %	In early March, trucks of the motor vehicle repair shop at Leipzig picked up spare parts and ZIS cylinder blocks at Oberschoeneweide.
	The vehicles from Leipzig picked up material once a month, ³ The side levers are about 40 to 50 cm high and rest on an oval socket measuring about 15 x 25 cm. They
	are cast in the foundry and finished in sections No I and II. Fach workshop
	truck was fitted with such a device. Side levers not used at the plant were presumably shipped to the equipment depot at Ketschenderf. The mobile welding carts are flat vehicles mounting devices for autogenous welding.
